4.10.1 Scale

4.10.2 Digital Zoom

Appendix I Sample Code of Camera Driver

Revision History
1. Overview of OV5640 Application

OV5640 is a 1/4 inch high performance 5M camera supporting both DVP and MIPI interface. This document focuses on DVP interface application of OV5640. For MIPI interface application of OV5640, please read “OV5640 Camera Module Application Notes (with MIPI interface)”

OV5640 could be used as

- 5M Main Camera for Cellular Phone Applications
- 5M Main Camera for Tablet Applications
2. Hardware Design

2.1 OV5640 Camera Module Reference Design

Note:

1. PWND, active HIGH as DOVDD is power down OV5640, should be connected to ground outside of module if unused
2. RESETB. Active LOW to reset OV5640, should be connected to DOVDD outside of module if unused
3. AVDD is 2.6-3.0V sensor analog power (clean). 2.8V is recommended. AVDD must be 2.5V+/-5% for OTP write, and OTP read does not have such requirement
4. DVDD is 1.5V+/-5% of sensor digital power(clean). Using the internal DVDD regulator is strongly recommended
5. DOVDD. 1.8V recommended is 1.7V-3.0V of sensor digital IO power(clean)
6. sensor AGND and DGND should be separated and connected to a single point outside PCB, Do not connect inside module
7. Capacitors should be close to the related sensor pins
2.2 Host Interface

2.1.1 Pin Definition

The video port of OV5640 has 10-bit, D[9:0]. For 10-bit RGB raw output, please use D[9:0]. For 8-bit YCbCr or 8-bit RGB raw or 8-bit RGB 565 output, please use D[9:2].

The Href and Hsync signal is on the same pin – Href. The function of this pin could be selected by SCCB setting.

The SIO_C and SIO_D bus should have external pull up resistors, the typical value of the pull up resistors is 5.1K.

RESET# is active low with internal pull-up resistor. Reset# should be controlled by backend chip for proper power up sequence.

PWDN is active high with internal pull-down resistor. PWDN should be controlled by backend chip for proper power up sequence.

2.2 Power Supply

If DOVDD of OV5650 is 1.8V, then DVDD is generated by internal regulator of OV5640. So 2 regulators should be used to supply powers to OV5640.
2.2.1 Host used 1.8V IO and OV5640 uses 1.8V IO

However, for some legacy phones or baseband chips, they only accepts 2.8V IO signals, for this kind of application, we suggest 5640 use 1.8V with level shift in between 5640 and host for all video signals.

In this case, 5640 works in the 1.8V IO, and host works in required 2.8V IO. For this case:

1) OV5640 output pins (HREF/HSYNC, VSYNC, DATA0~9, PCLK, FREX, STROBE, GPIO1~2) are tri-state when sensor is in standby mode (PWDN pin is high). Please make sure that it would not cause any problem(current leak) for other devices’ input. You may put 10kohm pull-down resistor on all tri-state pins if tri-state is an issue for level-shifter or host.
2) Add level-shifter for all video signals -- HREF/HSYNC, VSYNC, DATA0~9, PCLK.
3) Sensor SCL and SDA can tolerate high voltage. So it is no problem for 5640 to use 1.8V IO and I2C pull up resistors connect to 2.8V.
4) Sensor PWDN and XCLK are no problem for 2.8V signal. PWDN can directly connect to 2.8V for sensor power down. If has extra level shift pins, add level shift for these two pins as well.
5) For RESETB pin, please don’t provide 2.8V signal since 5640 has internal pull-up resistor to IO power. If provide 2.8V signal on this pin, it will cause power leak (from 2.8V signal to the sensor 1.8V IO power through the pull-up resistor and diode). Here are some solutions.
   a) Host drive this pin to low for reset mode, and change it to floating/input in operating mode and let sensor internal pull-up resistor to drive high (1.8V).
   b) Add level-shifter for RESETB as well.

If DOVDD of OV5640 is 2.8V, then DVDD is supplied from external power supply. So 3 regulators should be used. Power down mode is not supported for power saving here.

2.2.3 Host used 2.8V IO and OV5640 uses 1.8V IO

OV5640 also support 2.8V IO. If use 2.8V IO, the 1.5V DVDD must be supplied by external power. And power off mode is recommended for power saving. Power down mode is not supported for power saving.
2.3 **Deal with Lens**

2.3.1 **Light fall off**

Light fall off means the corner of image is darker than center of image. It is caused by the lens. The lens shading correction function of OV5640 could be turned on to compensate the corner brightness and make the whole picture looks same bright.

2.3.2 **Dark corner**

Some lens may have dark corner. Dark corner means the color of picture looks almost black. It is not possible to correct dark corner with lens correction. So the module with dark corner is NG, it can not be used.

2.3.3 **Resolution**

The resolution of camera module depends on lens design, focus adjustment and sensor resolution as well. The focus adjustment is very important for camera module assembly.

2.3.4 **Optical contrast**

The optical contrast of lens is very important to picture quality. If the optical contrast of lens is not good, the picture would looks foggy. Though it could be improved by increase the sensor contrast to make the picture sharper, the higher sensor contrast would make the detail lost of dark area of the picture.

2.3.5 **Lens Cover**

The lens cover is the cheapest part in optical path. But it could affect picture quality very much. The lens cover should be made with optical glass with AR coating at both side. Otherwise, the lens cover may cause sensitivity loss and/or stronger lens flare.

2.3.6 **Lens Correction**

Lens Correction setting should be tuned for every module. Please find lens correction settings of modules tuned by OVT FAE.

2.3.6.1 **Lens Correction:**

2.3.6.2 **Lens Correction:**

Note:

If module/lens you are using can not be found above, please contact with OmniVision local FAE for lens correction settings.
3. Hardware Operation

3.1 Operation Modes

3.1.1 Power Up

Step 1:
Reset# is applied to OV5640 camera module. PWDN is pulled high.

Step 2:
DOVDD and AVDD powers are applied. The 2 powers could be applied simultaneously. If applied separately, the power on sequence should be DOVDD first, and AVDD last.

Step 3:
after 5ms of AVDD reaching stable, pull PWDN to low.

Step 4:
after 1ms of PWDN go low, pull high Reset#.

Step 5:
After 20ms, initialize OV5640 by SCCB initialization. Please find the settings from section ?-?.

\[ t0: \geq 0\text{ms. Delay from DOVDD stable to AVDD stable.} \]
\[ t2: \geq 5\text{ms. Delay from AVDD stable to sensor power up stable.} \]
\[ t3: \geq 1\text{ms. Delay from sensor power up stable to Reset# pull high.} \]
\[ t4: \geq 20\text{ms. Delay from Reset pull high to SCCB initialization.} \]
3.1.2 Power Down

Step 1:
Pull PWDN pin high.

Step 2:
Pull XCLK low. XCLK should be kept more than 0.1ms after PWDN pulled high.

3.1.3 Wake up from Power down

Step 1:
Apply XCLK

Step 2:
after 0.1ms, Pull low PWDN

Optional Step 3:
Full SCCB initialization. Please find the settings from section ?-?.

3.1.4 Power OFF

Step 1.
Pull low XCLK,

Step 2.
Turn off AVDD, DVDD and DOVDD. The 3 powers could be turned off simultaneously. If turned off separately, DVDD should be turned off first, AVDD second and DOVDD third.
Step 3.

Pull Low PWDN and RESET

3.1.5 Hardware Reset

OV5640 sensor includes a RESETB pin that forces a complete hardware reset when it is pulled low (GND). OV5640 clears all registers and resets them to their default values when a hardware reset occurred. A reset can also be initiated through the SCCB interface by setting register 0x12[7] to high.

The whole chip will be reset during power up. Manually applying a hard reset after power up is recommended even through the on-chip power up reset is included. The hard reset is active low with an asynchronous design. The reset pulse width should be greater than or equal to 1ms.

3.2 Operations

3.2.1 OV5640 single camera, cut of power when not used

write_i2c(0x460b, 0x035);
write_i2c(0x460c, 0x22);
write_i2c(0x4837, 0x16);  // MIPI global timing
write_i2c(0x3824, 0x04);  // PCLK manual divider
write_i2c(0x5001, 0x83); // SDE on, CMX on, AWB on
write_i2c(0x3503, 0x03);
4.2 Signal Polarity

The signal polarity of OV5640 and baseband chip/ISP should be set to same to get correct image.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Register bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>VSYNC</td>
<td>0x4740[0]</td>
<td>1 – data valid Vsync high 0 – data valid Vsync low</td>
</tr>
<tr>
<td>PCLK</td>
<td>0x4740[5]</td>
<td>1 – data update at falling-edge 0 – data update at rising-edge</td>
</tr>
<tr>
<td>HREF</td>
<td>0x4740[1]</td>
<td>0 – data valid HREF high 1 – data valid HREF low</td>
</tr>
</tbody>
</table>

4.3 YUV Sequence

The YUV sequence of OV5640 output image should match with baseband chip/ISP to get correct image.
0x4300[0:1] control YUV sequence

//Y U Y V
write_i2c(0x4300, 0x30);

//Y V Y U
write_i2c(0x4300, 0x31);

//V Y U Y
write_i2c(0x4300, 0x33);

//U Y V Y
write_i2c(0x4300, 0x32);

4.4 Mirror and Flip

Since OV5640 is a BSI sensor, the light go to sensor from backside of sensor. So the image without mirror/flip looks mirror. The image with mirror looks normal.

i2c_salve_Address = 0x78;

MIRROR (default)

reg3820 = read_i2c(0x3820);
reg3820 = reg3820 & 0xf9; // flip off
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 | 0x06; // mirror on
write_i2c(0x3821, reg3821);
FLIP
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 | 0x06; // flip on
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 & 0xf9; // mirror off
write_i2c(0x3821, reg3821);

MIRROR&FLIP
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 | 0x06; // flip on
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 | 0x06; // mirror on
write_i2c(0x3821, reg3821)

Normal
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 & 0xf9; // flip off
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 & 0xf9; // mirror off
write_i2c(0x3821, reg3821);
4.5 Test Pattern

Color bar
write_i2c(0x503d, 0x80);
write_i2c(0x4741, 0x00);

Color square
write_i2c(0x503d, 0x82);
write_i2c(0x4741, 0x0);

4.6 Remove Light Band

OV5640_set_bandingfilter() function set banding filters automatically in camera driver.

Light band is removed by set exposure to \( \frac{n}{100} \) (\( \frac{n}{120} \) for 60Hz) seconds. The banding filter value tell OV5640 how many lines \( \frac{n}{100} \) (\( \frac{n}{120} \) for 60Hz) seconds.

\[
\text{Banding filter 50hz} = \frac{1}{100} \times \frac{1}{\text{HTS} \times \text{sysclk}} = \frac{\text{sysclk}}{\text{HTS} \times 100}
\]

\[
\text{Banding filter 60hz} = \frac{1}{120} \times \frac{1}{\text{HTS} \times \text{sysclk}} = \frac{\text{sysclk}}{\text{HTS} \times 120}
\]

HTS = register {0x380c, 0x380d}

sysclk could be calculated by the function OV5640_get_sysclk().
4.7 User Interface Functions

write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3

4.7.7 Night Mode

When night mode is turned on, dummy lines is inserted automatically and the frame rate is
decreased. The total dummy line inserted in controlled by register 0x3a02, 0x3a03 for 50hz light
and 0x3a14, 0x3a15 for 60hz light. The night mode on/off switch is controlled by register 0x3a00
bit[2].

Night Mode On
        temp = read_i2c(0x3a00);
        temp = temp | 0x04;
        write_i2c(0x3a00, temp);

Night Mode Off
        temp = read_i2c(0x3a00);
        temp = temp & 0xfb;
        write_i2c(0x3a00, temp);

4.7.8 Banding Filter Selection

The camera driver of OV5640 supports banding filter calculation. So there is no need to set
banding filter manually. There are 4 options for banding filter, they are

Off
        temp = read_i2c(0x3a00);
        temp = temp & 0xdf;    // turn off banding filter
        write_i2c(0x3a00, temp);

Manual 50Hz
        write_i2c(0x3c00, 04); // set to 50Hz
        write_i2c(0x3c01, 80); // manual banding filter
        temp = read_i2c(0x3a00);
        temp = temp | 0x20;    // turn on banding filter
        write_i2c(0x3a00, temp);

Manual 60Hz
        write_i2c(0x3c00, 00); // set to 60Hz
        write_i2c(0x3c01, 80); // manual banding filter
        temp = read_i2c(0x3a00);
temp = temp | 0x20;  // turn on banding filter
write_i2c(0x3a00, temp);

**Auto Detection**

write_i2c(0x3c01, 00);  // auto banding filter
temp = read_i2c(0x3a00);
temp = temp & 0xdf;  // turn off banding filter
write_i2c(0x3a00, temp);

The auto detection function depends on input clock. If input clock is not 24Mhz, please contact with OmniVision local FAE for setting update.

### 4.8 Auto Focus

#### 4.8.1 Embedded Auto Focus Solution

The auto focus function of OV5640 is controlled by built-in micro-controller, and the AF driver is also built in OV5640 sensor. The firmware of micro-controller is downloaded from host. After firmware is running, the built-in micro-controller of OV5640 read auto focus information from sensor, calculate the focus position and driver VCM to the position. The host controls the function of built-in micro-controller by I2C commands.

#### 4.8.2 I2C Commands for Auto Focus

<table>
<thead>
<tr>
<th>Register name</th>
<th>Address</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
</table>
| CMD_MAIN       | 0x3022  | Auto focus’ main commend register | 0x03 - Trig Single Auto Focus  
0x06 - Pause Auto Focus  
0x08 - Release Focus  
0x12 - Re-launch Focus Zones  
0x00 – command is finished |
| CMD_ACK        | 0x3023  | ACK of commend | 0x00 - Commend is finished  
0x01 - Commend is running |
| FW_STATUS      | 0x3029  | Status of focus | 0x7F - _S_FIRWARE  
Firmware is downloaded and not run.  
Cause 1 MCU is off  
Cause 2 Firmware is not correct.  
0x7E - _S_STARTUP  
Firmware is initializing.  
0x70 - _S_IDLEIdle state,  
focus is released. lens is located at the furthest position.  
0x00 - _S_FOCUSING  
Auto Focus is running.  
0x10 _S_FOCUSED  
Auto Focus is completed. |
Note: The MCU will auto clear CMD_MAIN to zero after the command is receipt, and auto clear CMD_ACK to zero when the command is completed.

### 4.8.3 AF Sequence

There is registers read and written by using OV5640 auto focus firmware sequence,

The auto focus steps as below:

1. Download firmware  
   when enter preview for the first time
2. Auto focus  
   when capture
3. Release focus  
   when finished capture and return to prreview

### 4.8.4 Download firmware

After initial OV5640, the AF firmware can be download. It is same as download the initial setting. To speedup firmware download, I2C multiple bytes write is highly recommended.

After download the firmware, please check the registers below:

<table>
<thead>
<tr>
<th>Register</th>
<th>Bit6</th>
<th>Bit5</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCU on</td>
<td>0x3000</td>
<td>0</td>
</tr>
<tr>
<td>AFC on</td>
<td>0x3001</td>
<td>0</td>
</tr>
</tbody>
</table>

### 4.8.5 Auto focus

Auto focus should be completed before capture sequence started.

1. Write 0x03 to register 0x3022 to start single focus
2. read back register 0x3029, if the read back value is 0x10, then focus is finished.
3. Write 0x06 to register 0x3022 to pause auto focus. Lens will stay in current focus position.

### 4.8.6 Release Focus

After capture, Write 0x08 to register 0x3022 to release the position of lens, let the lens move back infinite.

### 4.9 Capture Sequence

#### 4.9.1 Shutter

The shutter of OV5640 controls exposure time. The unit of shutter is line period. Shutter value has limitation for each resolution. The maximum shutter value is VTS(0x380e, 0x380f) - 4.
Shutter register value is 16 multiple exposure lines. The shutter value are stored in 3 registers, reg0x3500, reg0x3501, reg3502.

\[
\text{Shutter} = (\text{reg0x3500} \ll 12) + (\text{reg0x3501} \ll 4) + (\text{reg3502} \gg 4);
\]

### 4.9.2 Gain

Gain is stored in reg0x350a and Reg0x350b.

\[
\text{Gain} = ((\text{reg0x350a} \& 03) \ll 4) + (\text{reg0x350b} \gg 4);
\]

### 4.9.3 Dummy Lines and Dummy Pixels

If enable auto-night mode of OV5640, the dummy lines are automatic inserted. The number of dummy lines are controled by register \{0x3a02[3:0], 0x3a03\} for 60Hz and \{0x3a14[3:0], 0x3a15\} for 50Hz.

Dummy pixels are used to adjust timing. Please adjust HTS register \{0x380c, 0x380d\} to insert dummy pixels.

### 4.9.4 Capture Sequence

#### 4.9.4.1 Auto Focus

- Trigger single auto focus
- Pause auto focus (hold lens at focused position)

#### 4.9.4.2 Read Preview Registers

- Read preview_shutter
- Read preview_gain
- Read preview_HTS
- Read preview_sysclk
- Read preview_bining_factor B

#### 4.9.4.3 Change Resolution to Capture

- Download Capture setting. Turn off AGC/AEC.

#### 4.9.4.4 Read Capture Register Values

- Read capture_HTS
- Read capture_VTS
- Read capture_banding_filter
- Read capture_SYSCLK
4.9.4.5 Preview Gain/Exposure to Capture/Gain Exposure

The shutter of capture should have same time as preview.

\[
capture\_shutter = preview\_shutter \times \frac{capture\_PCLK}{preview\_PCLK} \times \frac{preview\_HTS}{capture\_HTS} \times B
\]

\[
capture\_gain = preview\_gain
\]

Where B is binning factor. B=1 for OV5640.

Under strong light, when \( preview\_shutter = 1 \), after calculation \( capture\_shutter=0 \) due to error of integer calculation. To avoid such issue, we may calculate like this

\[
preview\_shutter = capture\_shutter
\]

\[
capture\_gain = preview\_gain \times \frac{capture\_PCLK}{preview\_PCLK} \times \frac{preview\_HTS}{capture\_HTS} \times B
\]

4.9.4.6 Gain to Exposure and Capture Banding Filter

\[
gain\_exposure = capture\_shutter \times capture\_gain;
\]

If \( gain\_exposure < capture\_banding\_filter \) {
    // capture\_shutter < 1/100
    capture\_shutter = gain\_exposure;
    capture\_gain = gain\_exposure/capture\_shutter;
}
else {
    if ( gain\_exposure > (capture\_VTS - 4)) {
        // exposure reach maximum
        capture\_shutter = capture\_VTS - 4;
        capture\_gain = gain\_exposure/capture\_shutter;
    }
    else {
        // 1/100 < exposure < max, capture\_shutter = N * capture\_banding\_filter
        capture\_shutter = int (gain\_exposure/capture\_banding\_filter) * capture\_banding\_filter;
        capture\_gain = gain\_exposure/capture\_shutter;
    }
}

4.9.4.7 Write gain/exposure value

Write capture\_gain
Write capture\_shutter
4.9.4.8 Capture

Wait for 2 Vsync
Capture the 3rd frame.

4.9.4.9 Back to Preview

// release auto focus, release lens back to infinite.
//Write Registers, Change to preview
//Start AG/AE
write_i2c(0x3503, 0);

4.10 Scale and Zoom

To use scale/zoom function, the ISP scale 0x5001[5] must be set to '1'. To make sure zoom/scale changes smoothly, I2c group write is highly recommended.

4.10.1 Scale

OV5640 ISP support down scale. Images could be scaled down to any size less than 2592x1944. If the aspect ratio of output image is same as sensor image (4:3), adjust register DVPHO and DVPVO to get the desired image size. For example, to get 2048x1536 output

\[
\begin{align*}
DVPHO &= 2048 \\
DVPVO &= 1536 \\
H \text{ offset} &= 16 \\
Y \text{ offset} &= 4
\end{align*}
\]

write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x3808, 0x08); // DVPHO = 2048
write_i2c(0x3809, 0x00); // DVP HO
write_i2c(0x380a, 0x06); // DVPVO = 1536
write_i2c(0x380b, 0x00); // DVPVO
write_i2c(0x3810, 0x00); // H offset = 16
write_i2c(0x3811, 0x10); // H offset
write_i2c(0x3812, 0x00); // V offset = 4
write_i2c(0x3813, 0x04); // V offset
write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3

If the aspect ratio of output image is different as sensor image (not 4:3), then need to adjust X offset and Y offset to clip input image to same aspect ratio as output image. For example, to get 1280x1024 output

\[
\begin{align*}
DVPHO &= 1280 \\
DVPVO &= 1024 \\
\text{input image height} &= 1944
\end{align*}
\]
input image width = 1944 * 1280/1024 = 2430
X offset = 16
Y offset = 4 + (2592 - 2430)/2 = 85

```
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x3808, 0x05); // DVPHO = 1280
write_i2c(0x3809, 0x00); // DVP HO
write_i2c(0x380a, 0x04); // DVPVO = 1024
write_i2c(0x380b, 0x00); // DVPVO
write_i2c(0x3810, 0x00); // H offset = 16
write_i2c(0x3811, 0x10); // H offset
write_i2c(0x3812, 0x00); // V offset = 85
write_i2c(0x3813, 0x55); // V offset
write_i2c(0x3212, 0xa3); // launch group 3
```

4.10.2 Digital Zoom

For any image output size less than 2592x1944, increase X offset and Y offset in such way that the aspect ratio of input image match with aspect ratio of output image, digital zoom function is implemented by this way. For example, when output image is 1600x1200

**Digital Zoom 1x**

DVPHO = 1600
DVPVO = 1200
X offset = 16
Y offset = 4

```
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x3808, 0x06); // DVPHO = 1600
write_i2c(0x3809, 0x40); // DVP HO
write_i2c(0x380a, 0x04); // DVPVO = 1200
write_i2c(0x380b, 0xb0); // DVPVO
write_i2c(0x3810, 0x00); // H offset = 16
write_i2c(0x3811, 0x10); // H offset
write_i2c(0x3812, 0x00); // V offset = 4
write_i2c(0x3212, 0xa3); // launch group 3
```

**Digital Zoom 1.5x**

DVPHO = 1600
DVPVO = 1200
input image width = 2592/1.5 = 1728 > 1600
input image height = 1944/1.5 = 1296 > 1200
X offset = 16 + (2592 – 1728)/2 = 448
Y offset = 4 + (1944 – 1296)/2 = 328
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x3808, 0x06); // DVPHO = 1600
write_i2c(0x3809, 0x40); // DVP HO
write_i2c(0x380a, 0x04); // DVPVO = 1200
write_i2c(0x380b, 0xb0); // DVPVO
write_i2c(0x3810, 0x01); // H offset = 448
write_i2c(0x3811, 0xc0); // H offset
write_i2c(0x3812, 0x01); // V offset = 328
write_i2c(0x3813, 0x48); // V offset
write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3
Appendix I Sample Code of Camera Driver

Revision History

Rev 2.01

Merge from “OV5640 Camera Module Software Application Notes” and “OV5640 Camera Module Hardware Application Notes”.

Rev 2.10

Add auto focus support.

Rev 2.11

Update contrast setting (as DB version A10/AM10).

Add 4.10 Scale.

Update demo driver. Move driver code from “Form1.h” to “PantherDemo.cpp”

R 2.12

Fixed capture exposure bug in driver code.

Add “write_i2c(0x4005, 0x1a); // BLC always update” in initial setting.

Update Initial Setting
